

DSA2 Project Integration Report

1. Introduction

This report outlines the integration process for the Linguistic Text Search Analysis project as part of our DSA2 coursework. The project was collaboratively developed by Marco, Agnes, Lele Huang, and Ruonan Mi. The integration and Maven configuration were primarily handled by Ruonan Mi, with all members contributing to design discussions and providing functional modules.

2. Integration Steps

1. The original Java-based GUI project 'LinguisticSearch' was refined and restructured into a Maven-compatible project.
2. Necessary dependencies, including OpenNLP and jsoup, were defined in the pom.xml file.
3. GUI functionality was debugged to ensure that search results could be processed and displayed from a sample .txt file.
4. The project directory was placed under the GitHub repository 'group6', replacing older or placeholder directories.
5. Local changes were committed using GitHub Desktop and pushed to the remote main branch.

3. Team Contributions

- Marco, Agnes, and Lele Huang participated in function discussions, refinement, and bug analysis.
- Ruonan Mi handled code integration, Maven setup, IntelliJ project configuration, and GitHub deployment.
- All members contributed to UI design ideas, feature validation, and testing.

4. Conclusion

The final project successfully meets the core objectives of GUI-driven linguistic text search with filtering and annotation options. It is structured for easy future extension and public hosting.
